

Application Portfolio Management

Effectively manage and rationalize your application portfolio

Successful application portfolio management (APM) requires an inventory of your company's applications together with metrics to understand their fit and value to the business. iServer's application portfolio management solution lets you see how apps connect with business processes and their supporting technologies, make key rationalization decisions, and lower your operational IT costs.

Answer the fundamental questions with iServer's rich interactive dashboards

What are the consequences of a system failure?

Which applications support business critical capabilities?

Which applications in the current landscape overlap functions?

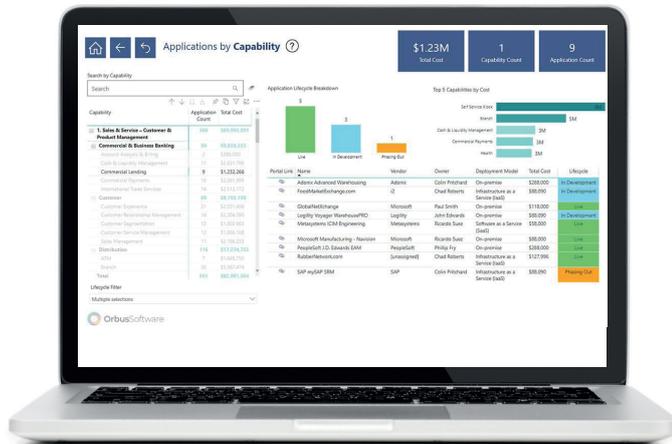

The APM dashboards are driven by predefined views in the iServer repository and rendered using Microsoft's Power BI.

Application Portfolio Management

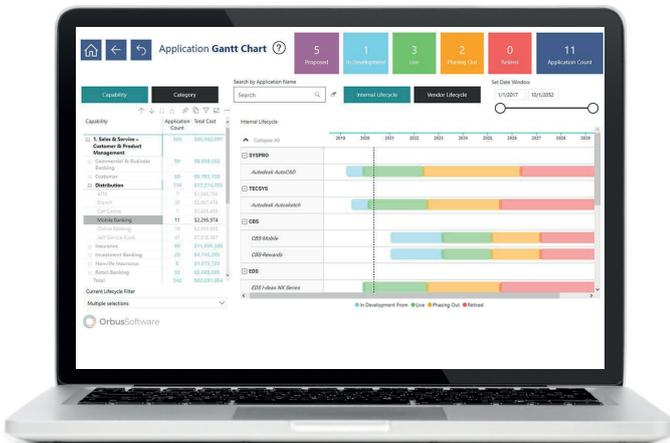

Applications by Capability

Understand how applications support business capabilities. See cost roll-ups; vendor dependencies and other key information

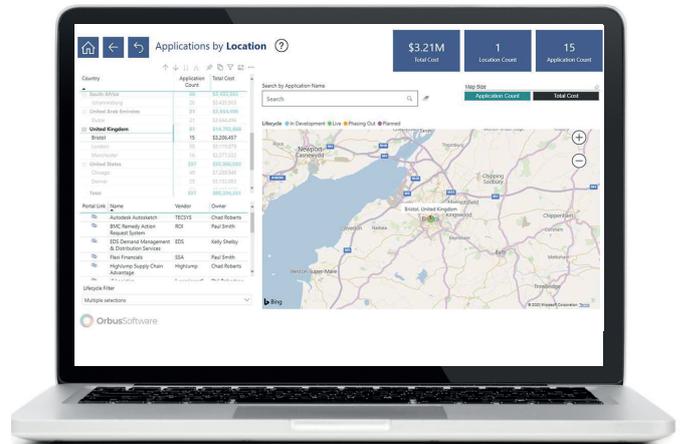

Application Gantt chart

Visualize application lifecycle on a dynamic Gantt chart. View the roadmap of applications for a particular capability, or vendor

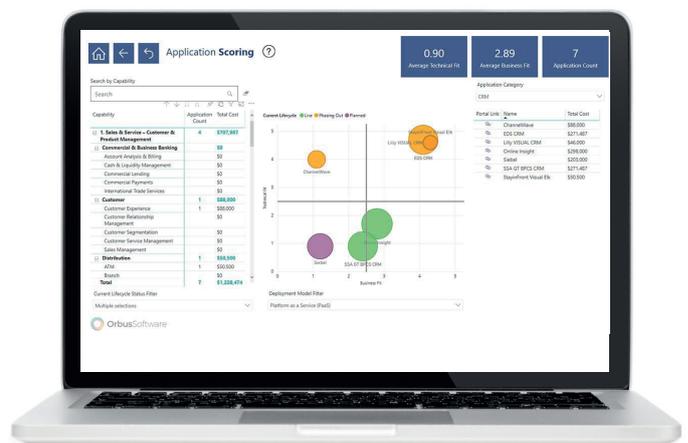

Applications by location

View and interactive map of how applications and application costs are divided across geographies

Application Scoring

Visualize to suitability of applications according to the business & technical fit scores, to make rationalization decisions
