iServer Consultancy Services:

Content Conversion, Migration and Integration

Overview

Importing data, establishing integrations and migrating to new tools all present unique challenges. Overcome these obstacles with support from the Orbus services team, who can assist you in a range of areas, including converting and migrating inputs, establishing ongoing integrations, meta-model mapping and data advisory, configuration changes, content conversion (diagrams or raw data), imports, and application connector development.

What We Offer:

Model Conversion

If you're switching to iServer from another tool, you don't need to duplicate work. You can leverage the Orbus content migration service, which lets you convert legacy artifacts into usable formats.

Data Migration

As you undergo digital transformation, it's likely you're handling vast amounts of data, and moving this around can be a significant task. Therefore, we provide support on loading content into iServer, whether as diagrams or raw data to assist with this project.

Integrations

iServer's API can be used to successfully integrate with upstream and downstream systems. Depending on your organization's needs, our services team can advise on these integrations and develop the necessary connections to make your digital transformation a success.
