

iServer Consultancy Services:

Implementation and Configuration

Overview

Tailor iServer configuration to support your organization's needs and objectives. Whether it's for a new implementation, a specific project, or as a consequence of changing requirements, you can leverage support for the entire iServer application and all additional modules developed by Orbus Software.

What We Offer:

Metamodel and Repository Configuration

iServer often utilizes preconfigured solutions that support industry leading standards such as TOGAF 9.2. This offers a valuable starting point, but you may want tailoring to implement a custom metamodel. Our consultants ensure your metamodel is suitable for communication, analysis and reporting, and will configure all areas of your repository.

Metadata Alignment, Configuration and Data Import

Organizations differ widely in maturity when it comes to data completeness, quality, and structure. By critically analyzing your data and long-term goals, our consultants deliver practical and bespoke guidance.

Role-Based Experience

iServer permits the flexible definition of user-profiles that structure a user's experience of the tool. This includes security and access rights, the content created, how that content appears and where different teams work and interact. Learn how you can map out these profiles and ensure iServer's implementation is aligned to the collaboration needs of your business.

Reference Model Implementation

iServer's flexibility makes it easy to use with a range of reference models and frameworks. However, in some instances you might want a bespoke model, specific to the needs of your enterprise architecture project. If it isn't one we provide out-of-box, we'll work closely with you to integrate and implement it within iServer, ensuring all your requirements are met.
