

iServer Consultancy Services:

Viewpoint Alignment and Development

Overview

Creating the right outcomes is crucial to both your enterprise architecture project and your iServer investment. If you want to implement a new modeling aesthetic, create advanced data-driven roadmaps, or simply ensure the diagrams you create in iServer tell the right story, our consultants can offer support. Leveraging deep Visio development expertise with a breadth of framework knowledge and experience, they'll work with you to deliver the right solution.

What We Offer:

Viewpoint Tailoring

While there is an extensive set within the iServer standard-based solutions, it's possible to tailor existing, and create new, viewpoints - from extending process models and capability maps, through to infrastructure and application integration diagrams.

Roadmap Development

Your roadmap is likely bespoke to your organization and end goals. Therefore, our consultants will help you develop custom roadmaps to support strategic analysis, project management, application and technology lifecycle management, and architectural state management.

Custom Notations

You can take advantage of iServer's flexibility and integration with Visio to enable modeling with any given visual notation. Working closely with our consultants, you will be able to create and develop custom data-driven Visio shape behavior and implement preference-based aesthetics.
