iServer for Government Organisations

iServer is a market leading enterprise transformation suite that supports organisations around the world in their Business and IT Transformation processes. The platform is mature and comprehensive, and is currently employed by a number of Australian government bodies.

iServer offers support for a wide range of standards and reference architectures that are crucial in enabling government organisations to carry out their change initiatives successfully. Whether your priority is digitalisation, improved cybersecurity practices, or better integration with another agency, iServer helps you achieve goals quickly and effectively, while also maintaining compliance status.

Here are some of the mainstream government frameworks and standards supported by iServer:

TOGAF

The Open Group Architecture Framework is a well-documented body of knowledge that comprises a detailed method for developing enterprise architectures, as well as a set of tools to support this activity. The framework is the de facto industry standard, being the result of decades of collaboration between some of the world's leading companies and institutions. TOGAF enables professionals to develop an EA that is consistent and reflective of stakeholders' needs, as well as the current and future requirements of the business.

ArchiMate

ArchiMate is an open and independent modelling language that provides a body of knowledge to support any organisation's EA efforts. ArchiMate lets architects describe the construction and operation of business processes, organisational structures, information flows, IT systems and technical infrastructure. This provides the stakeholders with valuable guidance when it comes to designing, assessing and communicating the consequences of any planned changes.

COBIT 5

COBIT 5 is a mainstream, business-focused framework that helps organisations make the best use of their IT function. It does this by offering guidance into maintaining a balance between realising benefits, on one hand, and optimising risk and resource usage on the other. COBIT 5 consists of a process reference model, a series of governance and management practices, as well as a set of enabler tools to support these practices.

iServer is a remarkably flexible tool so we are able to support any framework upon request, such as DoDAF or the AGA Framework. Just let us know your requirements!

Features

- Central repository acting as single source of truth for all enterprise content
- The most flexible meta-model on the market
- Familiar modelling environment
- Superb, business-friendly visuals and models
- Mature governance tools
- Powerful communication capabilities

Benefits
