

# Business and IT Transformation Suite

## Communication Modules

*Share repository content with key stakeholders and the wider business*

### iServer Portal

Allows users to share their repository content (models and documentation) online with the rest of the enterprise, improving engagement and increasing the visibility and buy-in to the work each team is doing.

### iServer HTML Publisher

Create interactive websites (“publications”) by publishing repository content to HTML, increasing the visibility of content and enhancing collaboration across the enterprise. The module offers full cross-platform support including phones, tablets, and desktops, so anyone in the organization can be reached whether in the office or on the move.

### iServer Live Documents

With this module, users can quickly generate customized, repository based documentation within the familiar Microsoft Word environment. The documents also refresh whenever the source material is changed, greatly reducing the time taken for teams to produce key deliverables.

### iServer Reporting Services

iServer’s reporting engine is built upon Microsoft SQL Reporting Services, Microsoft’s standard reporting platform. This means business users can leverage existing skillsets to quickly and easily generate reports and engage the wider business.

# Integration Modules

*Connect with established Management Systems and legacy tools*

## iServer Data Exchange

Easily load large quantities of data into the repository from Excel or XML sources through an easy to use import wizard. This bulk-import facility ensures huge time-saving when populating the repository, and minimizes the manual effort needed to keep iServer in sync with other tools.

## iServer Process Simulator

Allows users to create powerful process simulations from models created in Microsoft Visio, the modeling interface for iServer. This provides risk-free animated visualizations which allow analysts to determine precisely which processes and scenarios will provide the best results for the organization.

## iServer BPM Connect

Allows users to export Visio process diagrams for import and execution within a Business Process Management Suite (BPMS). This facilitates the automation of business processes modeled within iServer. Available from 2015.

## iServer SAP Connect

Creates a bi-directional interface between iServer and SAP Solution Manager for the interchange of business processes, transactions and documentation, accelerating SAP implementations and upgrades by making use of iServer's powerful modeling interface, web-based communication and reporting capabilities.

## iServer Data Modeler Connect

Bridge the gap between Data Modeling experts and Architects by integrating data models with iServer via Microsoft Visio. Data Modeler Connect not only saves times and eliminates duplication of effort but also eliminates discrepancies between the data and architecture domains.

## iServer BI Connect

Allows organizations to leverage the iServer repository as an additional data source for their existing Business Intelligence toolset, enabling stakeholders to browse iServer data dynamically for data discovery and ad-hoc reporting, via configurable dashboards in the third party BI tool.
