BPMN 2.0 Business Process Model and Notation

Level 1: Descriptive

### Pools and Lanes

**A Pool** is used to define either a group of Participants such as an area within an organization or an external entity that collaborates within a process.

A process model is normally created from the perspective of a single participant – the **White Box Pool**, and contains the detail of that process. **Black Box Pools** are considered external to the scope of the process (although not necessarily outside of the organization), and do not show flow and activities. Black box pools may be collapsed and rotated, but do not have to be.

**A Lane** is used to define a specific participant or role within a process.

A lane may be contained within a pool or may itself be broken down into other lanes.

### Flows

**Message Flow** is the flow of information as messages between Participants.

**Sequence Flow** is the flow of the process between events that occur, activities performed by the lanes and decisions that are made (gateways).

**Data Association (Directional)** are used to attach artifacts (such as data objects) to activities.

**Data Association (Bidirectional)** are used to read or write data, that persists beyond the scope of the process.

**Data Objects** are inputs to and outputs from activities. Data objects could be used to represent documents, data or other objects that are passed between the activities in a process.

**Data Store** is somewhere that the process can read or write data, that persists beyond the scope of the process.

### Activities

Within the flow of a process, one or more lanes will perform a number of activities.

- **A Task** is something that a lane (role) does during the process. A task is a granular (atomic) activity that cannot or does not need to be broken down any further.

- **A User Task** is a task performed by an actor, role or organization unit.

- **A Service Task** is a task carried out by a system.

- **A Sub Process** summarizes a group of activities, and can be expanded out into further detail. Sub processes can be shown as collapsed (with the [-] symbol), or expanded.

### Events

An Event is an indicator that something has happened within a process.

- **A process begins with a Start Event indicating something has happened, such as a message received or a date that has been reached.**

- **A process finishes with an End Event.** Because a process may have several outcomes, there may be multiple and events.

### End Event

**Intermediate Events** happen within the flow of the process (between the start and end events).

- **A process may have several End Events.** Because a process may have several outcomes, there may be multiple and events.

### Core BPMN Objects

**Start Event**

**Receive Task**

**Send Task**

**Receive Task**

**Send Task**

**Business Rule**

**Service Task**

**Parallel Multiple Instance**

**Instance**

**Script**

**Intermediate Event**

**End Event**

**Message Flow**

**Data Association (Directional)**

**Data Association (Bidirectional)**

**Data Store**

**User Task**

**User Task**

**Process Flow**

**Gateway**

**Activity**

**Association**

### Gateway

**Gateways represent decisions within the process, and control the splitting and merging of sequence flow.**

- **A Parallel Gateway** is used to synchronize parallel flows and to create parallel flows.

- **A Converging Exclusive Gateway** is used to create alternative paths within a Process flow. A Converging Exclusive Gateway is used to merge alternative paths.

### Artifacts

Artifacts allow additional information to be provided on a process model.

- **A Message** is used to depict the contents of a communication between 2 participants.

- **A Group** is a visual way of informally grouping items on a diagram, for example to highlight an area that requires further analysis.
